

# DXS Granite Measurement Guide

Customer Name	Address	Town	Zip	Phone

## The Purpose of Your Initial Measurement.

The measurements and sketches that you provide to us are used by our staff to prepare a preliminary estimate for your project. Absolute accuracy at this stage is helpful but not critical. Dimensions are later verified with an on-sight field measurement by our staff.

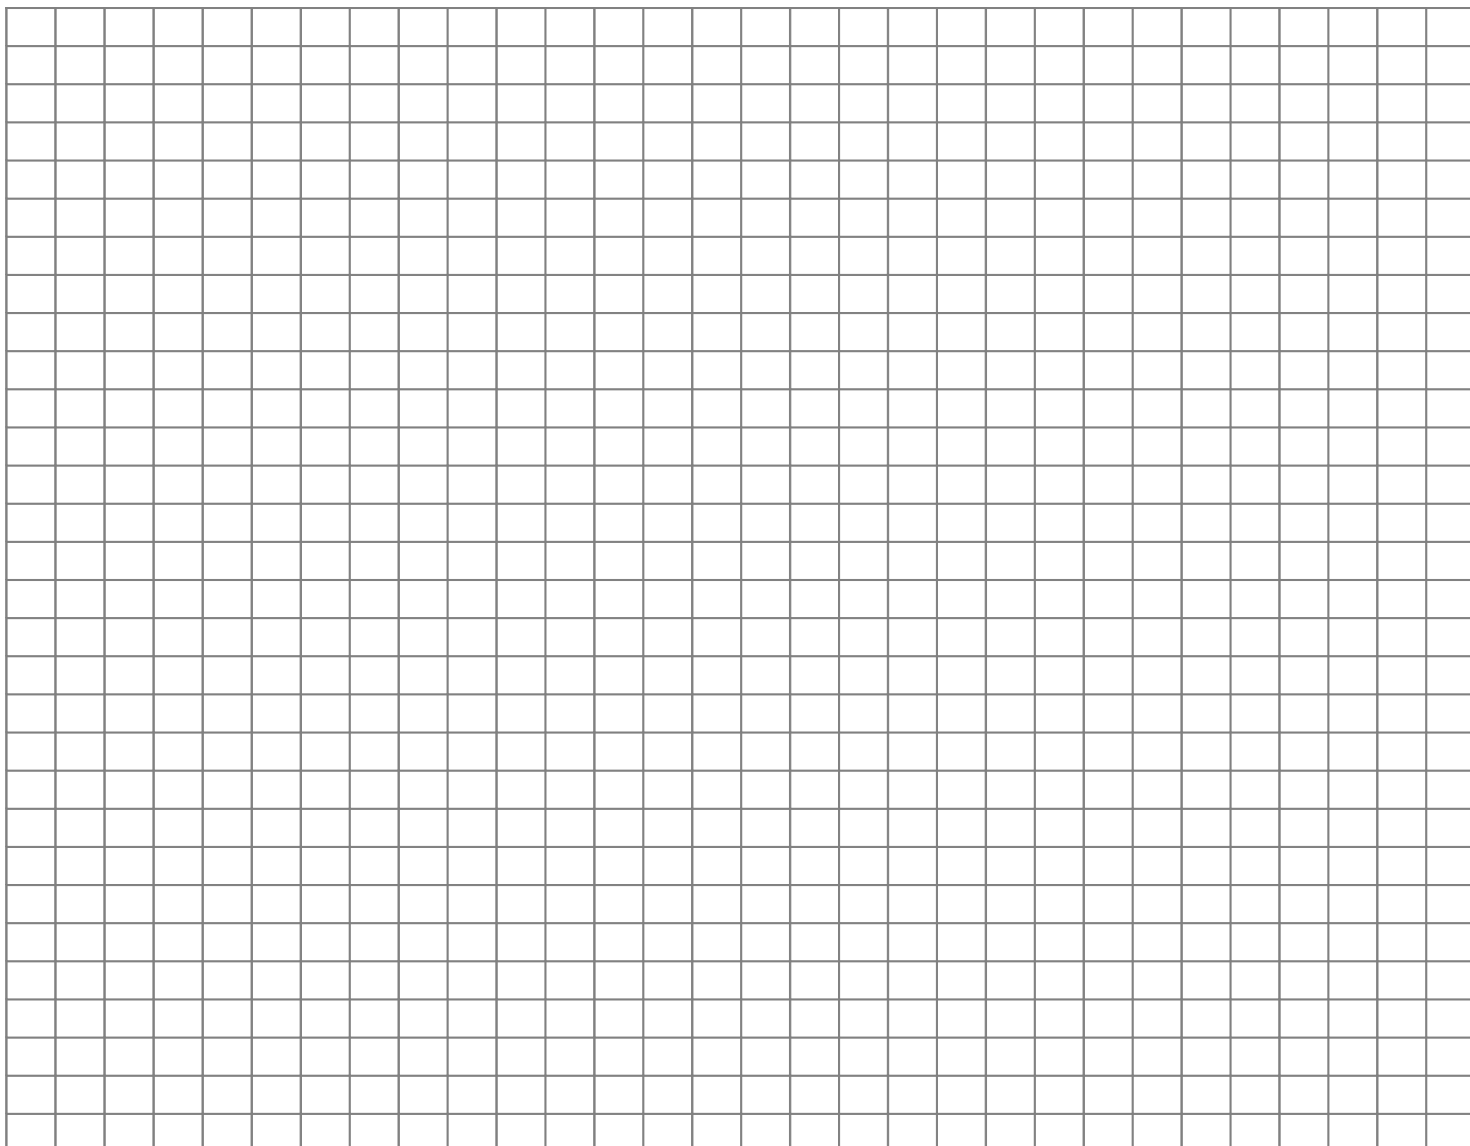

- Appliances:** Determine the exact area of the new counter top location. Determine if existing appliances will remain. If new appliances will be purchased, will this change the existing layout?
- Sinks and Faucets:** Determine if a new kitchen sink(s) or faucet(s) will be added.
- Existing Cabinetry:** If the cabinetry is remaining and not being relocated, sketch the shape of your existing layout. Using a tape measure, start to measure the length and width of your existing countertops. This should begin at one end of a cabinet/appliance/wall and continue the entire length of the run. In a layout that is located in the corner of two adjoining walls, (see example), measure the length of the run to the actual inside wall corner. When completed, measure the depths of all areas starting at the back wall running to the front edge of the existing countertop.

## Your Preliminary Estimate

Once we have your measurements and specifications, we'll submit a preliminary estimate for the proposed work. Should you wish to modify any of the items, we will promptly issue a revised estimate. Once all details are finalized, we are ready to proceed with...

## Field Measurement and Final Quotation

We will schedule a convenient time for an on-sight measurement by one of our staff. We then submit a formal drawing or plan for your project along with our final quotation for your approval.
